12.13.1.8 Question: Compute $\Pr(E|F)$ where E and F are: A die is thrown three times, E : 4 appears on the third toss, F : 6 and 5 appears respectively on first two tosses.

Answer: $(\frac{1}{6})$

Solution:

F is the event that 6 and 5 occur respectively in first two tosses.

$$\Pr(F) = \frac{1}{6} \times \frac{1}{6} \quad (1)$$

$$\Pr(F) = \frac{1}{36} \quad (2)$$

The event EF consists of the only outcome 6,5,4 occurring in first three tosses.

$$\Pr(F) = \frac{1}{6} \times \frac{1}{6} \times \frac{1}{6} \quad (3)$$

$$\Pr(F) = \frac{1}{216} \quad (4)$$

We have,

$$\Pr(E|F) = \frac{\Pr(EF)}{\Pr(F)} \quad (5)$$

$$\Pr(E|F) = \frac{\frac{1}{216}}{\frac{1}{36}} \quad (6)$$

$$\Pr(E|F) = \frac{1}{6} \quad (7)$$
